Supply Chain Dashboard Analysis & Business Report

Seven-section portfolio documentation based on the five-page Power BI dashboard.

1. Project Overview

This project analyzes purchasing and order activity across multiple business locations, suppliers, and products. Its objective is to provide a consolidated view of order volume, procurement cost, delivery performance, order urgency, and high-value purchasing patterns. The dashboard supports operational monitoring and helps procurement and operations users identify areas that may require follow-up or management attention.

Scope and business context: The dashboard displays 500 total orders and a total cost of 2.86M across four locations—Dhahran Branch, Dammam Branch, Saco Main Warehouse, and Al Khobar Branch. It also compares suppliers and products and presents monthly activity from January to December. The purpose is to make purchasing activity easier to monitor, compare, and investigate through an interactive Power BI report.

The supplied PDF does not identify the reporting year, currency, underlying data source, or formal definitions of urgent and high-value orders. These details should be documented in the Power BI model or project metadata.

2. Data Analysis & Methodology

The analysis uses a set of summary indicators and category-level comparisons. Users can filter the report using the visible slicers for Year, Month Name, Product, Location, Status, and Supplier. The dashboard then presents results across five analytical views: overview, location analysis, supplier analysis, product analysis, and monthly trends.

- **Order metrics:** total order count, delayed orders, urgent orders, and orders grouped by month, supplier, location, and product.
- **Cost metrics:** total cost and cost distribution by supplier, product, and month.
- **Performance metrics:** on-time order percentage, urgent-order percentage, and high-value-order percentage.
- **Comparative analysis:** ranking and comparing locations, suppliers, and products by quantity, cost, urgency, and high-value order share.
- **Trend analysis:** reviewing monthly order volume, monthly cost, and monthly high-value-order percentage to identify peaks, declines, and changes over time.

The PDF shows the resulting KPI values and chart labels but does not expose the DAX formulas, data model, calculation denominators, or business thresholds. Therefore, this report describes the displayed measures without inventing formula definitions.

3. Key Takeaways

- **Overall activity:** the overview reports 500 total orders and 2.86M total cost.
- **Delivery performance:** 143 orders are shown as delayed, while the on-time order rate is 51%.
- **Order urgency:** 116 urgent orders are displayed, and the urgent-order gauge is 23%.
- **High-value orders:** the overview gauge shows 36%.
- **Monthly order volume:** July is the highest month at 55 orders, while June is the lowest at 24 orders. December is also high at 51.
- **Monthly cost:** July and December are each approximately 0.34M, while June is approximately 0.15M.
- **Supplier order count:** National Hardware Wholesale leads with 102 orders, followed by Brightline Electrical Trading with 82 and ColorPro Paints with 69.
- **Product cost:** Copper Wire 2.5mm has the highest displayed product cost at approximately 0.65M, followed by Waterproof 4L at 0.39M.

4. Business Insights

Location insight: Saco Main Warehouse has the largest quantity share at 31.32%, followed by Dammam Branch at 28.75%, Al Khobar Branch at 25.57%, and Dhahran Branch at 14.37% (dashboard page 2). Saco also has the highest urgent-order share at 28.2%. The high-value-order percentages are highest in Dhahran at 40%, followed by Dammam at 38%, Saco at 36%, and Al Khobar at 33%.

Supplier insight: National Hardware Wholesale has the highest order count (102), but the supplier cost chart shows Brightline Electrical Trading as the largest cost contributor at approximately 0.8M, followed by ColorPro Paints at approximately 0.6M (dashboard pages 1 and 3). This distinction shows why order volume and spending should be monitored as separate supplier measures.

Product insight: Copper Wire 2.5mm is the largest displayed cost category (approximately 0.65M) and has a 100% high-value-order rate. Ceramic Tiles 60x60 (79%), Waterproof 4L (78%), and Plywood 18mm (76%) also show high high-value-order percentages (dashboard page 4). These products may warrant closer cost, stock, and purchasing review.

Monthly insight: the high-value-order percentage is 44% in January and 43% in February, declines to 22% in September, and then recovers to 41% in December (dashboard page 5). This pattern may be useful when reviewing purchasing cycles and planning, but the dashboard alone does not establish the cause of these changes.

5. Summary

The dashboard brings together order volume, procurement cost, delivery indicators, supplier and product comparisons, location performance, and monthly trends. It reports 500 orders with 2.86M in total cost, a 51% on-time order rate, 143 delayed orders, 116 urgent orders, and a 36% high-value-order rate. Results vary across locations, suppliers, products, and months. The analysis highlights delivery performance and concentrated purchasing activity as important areas for further operational review.

6. Conclusions

- The displayed 51% on-time order rate and 143 delayed orders indicate that delivery performance deserves management attention.
- Supplier order volume and supplier cost do not rank identically; both should be considered when evaluating supplier exposure.
- A limited set of products accounts for relatively high displayed procurement cost or high-value-order percentages.
- Urgency and high-value-order patterns differ by location and month, suggesting that operational monitoring should be reviewed at a more detailed level than the overall KPI totals.
- The dashboard is useful for identifying patterns, but root causes and final decisions require validation against transaction-level data and documented KPI definitions.

7. Recommendations

- **Manage delayed orders:** maintain a daily delayed-order exception list, assign an accountable owner, record delay reasons, and track supplier commitments through closure.
- **Build supplier scorecards:** monitor order count, total spend, urgent orders, delayed orders, and on-time performance for each supplier. Review high-volume and high-cost suppliers regularly.
- **Review critical products:** prioritize Copper Wire 2.5mm, Waterproof 4L, Plywood 18mm, and Ceramic Tiles 60x60 for stock availability, lead-time, reorder-point, and price monitoring.
- **Investigate location differences:** review the reasons behind Saco's larger quantity and urgent-order shares and Dhahran's higher high-value-order percentage. Compare demand, replenishment rules, and supplier lead times.
- **Use monthly procurement reviews:** investigate the June low in order volume and cost, July peaks, and September decline in high-value-order percentage. Align purchasing plans with confirmed demand.
- **Set measurable targets:** establish approved targets for on-time delivery, delayed orders, urgent orders, and procurement cost variance, then review performance monthly.

- **Improve data governance:** document the reporting year, currency, data refresh date, source system, KPI definitions, and formulas. Expand truncated supplier and product labels where possible.

Data limitation: *This report is based on the supplied five-page dashboard PDF only. The underlying transaction dataset and Power BI measures were not provided. Some chart labels are truncated, and the currency and reporting year are not visible. Validate these items before using the findings for financial commitments or formal supplier evaluation.*
