HEALTHCARE ANALYTICS DASHBOARD REPORT

Analysis, Findings, Conclusions and Recommendations

Prepared from the dashboard visuals and figures in the original supplied report.

1. Project Overview

This Power BI healthcare dashboard consolidates patient volume, visit costs, satisfaction, treatment status, insurance, doctor performance, diagnosis and department performance. Its purpose is to provide an operational and financial overview of healthcare services and help stakeholders explore patient activity, cost patterns, service experience and workload across doctors, diagnoses, departments, locations and months. The report includes Overview, Financial Analysis, Doctor Performance, Diagnosis Performance, Department Performance and Patients Summary views.

2. Data Analysis & Methodology

The overview displays 56K total patients, $1.417bn total visit cost, $26K average visit cost, 3.33 average satisfaction score and 37K ongoing treatment count. The report groups patients and costs by insurance provider, month, location, doctor, diagnosis and department. It compares revenue by insurance provider, treatment status and diagnosis; uses doctor-level patient counts, satisfaction scores and visit costs; and compares patient counts and satisfaction by department. Visual methods include KPI cards, donut charts, monthly line charts, bar charts, treemaps, tables and category comparisons. Available slicers are Month Name, Department, Diagnosis, Location and Treatment Status. The supplied PDF does not provide formula definitions, survey scale details, data-cleaning steps or a documented methodology for the satisfaction score; these should be added from the underlying model documentation.

3. Key Takeaways

• The overview reports 56K patients and $1.417bn total visit cost, with an average visit cost of $26K and average satisfaction score of 3.33.

• The dashboard shows 37K ongoing treatments, a substantial workload indicator that should be reviewed alongside treatment status and care capacity.

• Monthly patient volume fluctuates, with the chart generally ranging from approximately 4.2K to 4.8K; February is the lowest visible month, while July and August are among the highest.

• The financial analysis shows revenue by insurance provider in a narrow range of approximately $279M–$287M per provider, with each provider representing roughly 19.7%–20.3% of the displayed total.

• Revenue by treatment status is similar across the three displayed groups: Needs Treatment ($475.7M), Stable ($471.4M) and Under Observation ($470.3M).

• Revenue by diagnosis ranges from approximately $232.2M for Cancer to $238.5M for Diabetes. Patient counts by diagnosis are also relatively close, at roughly 7.8K–8.0K each.

• Patient counts by department are similar at approximately 9.2K–9.3K each. Satisfaction by department ranges from about 3.3 to 3.4, with Pulmonology and Cardiology at the top of the displayed chart.

• The doctor page includes patient volume, average satisfaction and total visit cost by doctor; the detailed patient table reports an overall average score of 3.33 and average visit cost of $25,539.

4. Business Insights

The relatively even patient distribution across diagnoses and departments suggests demand is spread across several service lines rather than concentrated in one category. Monthly fluctuations indicate a need to align staffing and appointment capacity with demand peaks and dips. The 37K ongoing-treatment indicator is important for continuity-of-care planning, follow-up scheduling and monitoring of unresolved cases. Similar revenue values across insurance providers and treatment statuses suggest that no single displayed group dominates the financial view. Department satisfaction scores are tightly grouped, so targeted improvement may require patient feedback at a more detailed level. Doctor-level cost and satisfaction comparisons can support service review, but differences should be interpreted in light of specialty, case complexity and patient volume.

5. Summary

The healthcare dashboard provides a combined view of patient activity, visit costs, satisfaction and service performance. It reports 56K patients, $1.417bn in total visit cost, a $26K average visit cost, a 3.33 average satisfaction score and 37K ongoing treatments. Patient volumes are relatively balanced across the displayed diagnoses and departments, while monthly activity fluctuates. The report can support operational planning and service-quality review when metric definitions and underlying data are validated.

6. Conclusions

The dashboard is a useful exploratory tool for understanding healthcare service demand, financial activity and patient experience. The high ongoing-treatment count and monthly variation are relevant to capacity and continuity-of-care planning. Satisfaction averages are relatively close across departments, while doctor-level variation may provide opportunities for further review. The dashboard is descriptive: it does not establish the causes of cost or satisfaction differences, treatment effectiveness, clinical outcomes or quality of care. Those conclusions require clinical context and validated outcome measures.

7. Recommendations

1. Monitor ongoing treatments by diagnosis, department, doctor and treatment status; develop follow-up lists for overdue reviews and unresolved cases.

2. Forecast monthly patient demand and align staffing, appointment slots and resources with observed peaks and lower-volume periods.

3. Review visit costs by diagnosis and doctor alongside case complexity, service type, insurance coverage and clinical outcomes; avoid judging performance on cost alone.

4. Investigate patient satisfaction at the question, department and doctor levels; use patient comments and service-recovery records to identify actionable causes.

5. Maintain balanced access across departments and monitor waiting time, appointment availability and referral delays alongside patient volume.

6. Review revenue and visit-cost patterns by insurer and treatment status, and reconcile financial totals to billing records and payer remittances.

7. Add clinical outcome and quality indicators where appropriate, such as follow-up completion, readmission, treatment adherence and outcome measures approved by clinical leadership.

8. Clearly define the satisfaction scale, average-cost calculation, ongoing-treatment definition, currency, reporting period and data-refresh date. Apply privacy controls to patient-level tables and restrict access to identifiable records.

Data Notes & Validation

Figures are transcribed from the supplied dashboard pages. The overview labels total visit cost as $1.417bn and average visit cost as $26K; the doctor table shows an overall average visit cost of $25,539, which is broadly consistent after rounding. The PDF does not state the satisfaction scale or explain whether the 37K ongoing-treatment count represents unique patients or treatment records. Confirm those definitions and reconcile dashboard totals to source billing and patient systems. The location visual on the overview page does not show readable location values in the supplied image, so no location ranking is asserted here.
