HR ANALYTICS DASHBOARD

Analysis, Findings, Conclusions and Recommendations

Prepared from the dashboard visuals and figures in the original supplied report.

1. Project Overview

This project uses a Power BI HR Analytics Dashboard to bring together employee headcount, workforce composition, leave activity, employee transactions, recruitment and payroll information. Its purpose is to help HR and management monitor workforce size and structure, understand hiring and employee exits, review leave and employee-related costs, and support evidence-based workforce planning. The dashboard covers five views: Employee Overview, Employee Leaves, Employee Transactions, Recruitment Analysis and Payroll Analysis.

2. Data Analysis & Methodology

The dashboard presents summary measures and grouped comparisons. Key displayed measures include headcount (18K), new hiring (1K), attrition (4K), turnover (21.49%), average age (42.01), total applicants (22K), active employees (18K), hired (1K), terminated (4K), acceptance ratio (53.85%), total payroll (103K), salaries (91K), benefits (12K), average salary (9.10K) and average benefits (1.20K). Leave analysis includes accepted requests (4), approved days (11) and average days per request (2.75). Transaction analysis groups overtime, business trips and educational allowances by transaction count, hours/days, amount and employee. Visual techniques include KPI cards, donut charts, bar charts, monthly trend charts, ranked employee lists and detail tables. The dashboard provides category and department breakdowns; the supplied report does not document the underlying DAX formulas, data-cleaning steps, source-system details or exact filter logic, so these should be documented separately if available.

3. Key Takeaways

• The workforce overview reports approximately 18K employees, 1K new hires and 4K attrition, with a displayed turnover rate of 21.49%. This makes retention a major area for HR attention.

• The active/terminated contract visual reports 18.29K active (82.31%) and 3.93K terminated (17.69%).

• Engineering is the largest department shown at approximately 6.7K employees, followed by Accounting at 3.3K. Sales, Human Resources and Training are each shown at roughly 1.7K–1.8K.

• The employee-leave page shows four accepted requests covering 11 days; annual, marriage, sick and study leave each have one request.

• Employee transactions show 10 overtime transactions (66 hours; 50K), 29 business-trip transactions (67 days; 38K), and 15 educational-allowance transactions (209.77K).

• Recruitment reports 22K applicants and a 53.85% acceptance ratio. Salary is the most frequently displayed candidate-decline reason (3), followed by experience and other (2 each).

• Payroll reports 103K total payroll, comprising 91K salaries and 12K benefits. Engineering has the largest displayed payroll by department at approximately 53K.

4. Business Insights

The combination of 4K attrition and a 21.49% turnover indicator suggests that retention, employee experience and exit analysis deserve management focus. Engineering's large headcount means that even modest changes in its retention or compensation profile may materially affect workforce planning. The leave dashboard provides a useful operational view of approved time away, while transaction reporting makes employee-related costs more visible. Recruitment data can help HR review sourcing channels and candidate-decline reasons, but the equal one-third source split and the 22K applicant headline should be checked against the underlying records before channel effectiveness is concluded. Payroll concentration in Engineering should be interpreted alongside department headcount, job mix and compensation policy rather than as evidence of overpayment by itself.

5. Summary

The dashboard provides a broad view of workforce composition, hiring, exits, leave, employee transactions and payroll. Its headline indicators show a sizable workforce, meaningful attrition, a recruitment acceptance ratio of 53.85%, and payroll dominated by salaries. Engineering is the largest department by headcount and the largest department by displayed payroll. These findings identify retention, workforce cost visibility and recruitment quality as useful priorities for HR review.

6. Conclusions

The dashboard is a useful management-monitoring tool because it combines several HR processes in one report. The displayed turnover rate and attrition count warrant deeper investigation, while department-level workforce and payroll breakdowns can support staffing and budget discussions. The dashboard alone does not establish why employees leave, whether hiring is effective over time, or whether compensation is competitive; those questions require validated employee-level records, time periods and supporting HR context.

7. Recommendations

1. Conduct an attrition deep dive by department, role, tenure, location and exit reason; establish a monthly retention review and targeted retention actions.

2. Prioritize workforce planning for Engineering while reviewing vacancies, workload, succession coverage and critical roles.

3. Track recruitment funnel conversion by source: applicants, shortlisted, interviewed, offers, accepted offers and hires. Validate the source totals and acceptance-ratio definition.

4. Review candidate-decline reasons, especially salary, and compare approved salary ranges with market benchmarks before changing compensation.

5. Monitor overtime hours and cost by department and employee; investigate recurring high overtime and opportunities to improve scheduling.

6. Review business-trip and educational-allowance spending against policy, approval records and business outcomes.

7. Maintain monthly payroll controls that reconcile salaries, benefits, headcount and department totals.

8. Add clear reporting dates, currency, metric definitions and data-refresh timestamps. Validate that rounded KPI cards and detailed totals reconcile before publishing.

Data Notes & Validation

The figures above are transcribed from the supplied dashboard pages and may be rounded. Some headline and chart values are presented at different precision. The report does not state the reporting period or currency for all HR transaction amounts. The payroll page displays the same 103K total for each month; confirm whether this is an intentional flat monthly value or a measure that is not responding to the month axis. Confirm the definitions of attrition, turnover and acceptance ratio, and reconcile the 22K applicant total with the recruitment-source chart before using them for formal decisions.
