FINANCIAL DASHBOARD REPORT

Analysis, Findings, Conclusions and Recommendations

Prepared from the dashboard visuals and figures in the original supplied report.

1. Project Overview

This Power BI financial dashboard is designed to summarize organizational financial performance through revenue, expenses and profit. It provides an overview and separate Revenue, Expenses and Profit views, with comparisons by category, department, region, month and expense approval status. Its purpose is to help management understand income sources, spending patterns, profitability and areas requiring budget or approval review.

2. Data Analysis & Methodology

The overview displays Revenue of 1.28M, Expenses of 563.83K and Profit of 718.57K, together with maximum revenue of 29.58K and maximum expenses of 15.18K. Revenue is segmented by category and department; expenses are grouped by expense category, department, region and month; profit is compared by department and month. Visual methods include KPI cards, treemaps, donut charts, monthly trend/area charts and side-by-side revenue-versus-expense bars. Report filters include Year, Month Name, Quarter, Category, Department and Region. The supplied PDF does not show the underlying DAX formulas, source tables, data-cleaning procedures or exact profit calculation; therefore, profit should be validated against the source ledger and measure definitions.

3. Key Takeaways

• The headline overview reports 1.28M revenue, 563.83K expenses and 718.57K profit.

• Product Sales is the largest visible revenue category at approximately 0.54M, followed by Subscriptions at 0.25M, Services at 0.23M, Other Income at 0.16M and Licensing at 0.10M.

• Revenue by department is led by Sales (approximately 1.41M in the department chart) and Operations (0.77M), followed by Finance (0.56M), IT (0.50M), Marketing (0.44M) and HR (0.31M).

• The revenue-by-month chart shows a high point around September (440K), with October at 412K and April at 410K; November is the lowest displayed month at 125K, followed by December at 241K.

• The revenue-by-region page shows Dammam at 1.39M, Jeddah at 1.32M and Riyadh at 1.28M.

• The expenses page shows the largest department expense in Sales (86K), followed by Operations (41K) and Marketing (32K). Licensing is selected in the displayed category slicer on that page.

• Expenses by region are shown as Jeddah 97.23K (45.28%), Riyadh 58.85K (27.41%) and Dammam 58.66K (27.32%).

• The profit page shows Sales as the largest profit-contributing department at 0.81M, followed by Operations (0.37M), IT (0.32M), Finance (0.30M), Marketing (0.21M) and HR (0.19M).

4. Business Insights

Product Sales and Subscriptions appear to be important revenue streams, making their performance useful indicators for commercial planning. Sales and Operations are prominent in the department revenue and profit visuals, while Sales also has the largest displayed departmental expenses; management should therefore review both contribution and cost efficiency together. The monthly revenue chart indicates substantial variation, particularly the November drop, which merits investigation by product, customer, region and transaction timing. The expense-region chart identifies Jeddah as the largest share of the displayed expenses. Approval-status monitoring can strengthen financial governance, but the approval visual should be linked to actual amounts and approval counts to show the scale and age of pending or rejected items.

5. Summary

The dashboard reports positive headline profit of 718.57K against revenue of 1.28M and expenses of 563.83K. Product Sales is the largest visible revenue category, Sales is prominent in both revenue and profit, and the monthly and regional views show meaningful variation. These findings can support revenue planning, expense control and management review, provided that the dashboard's totals and dimensional breakdowns are reconciled.

6. Conclusions

The dashboard offers a useful high-level view of financial performance and highlights where revenue and profit are concentrated. The reported headline figures suggest that revenue exceeds expenses in the selected view. However, several dimensional totals shown in the charts do not reconcile with the headline totals—for example, the regional revenue labels exceed the 1.28M headline revenue, and the Sales department revenue label is higher than the headline. These differences may reflect different filters, aggregation logic, periods or model relationships and must be resolved before the figures are used for formal financial reporting.

7. Recommendations

1. Reconcile the revenue, expense and profit measures to the general ledger; document whether profit is revenue minus expenses and confirm the reporting period and currency.

2. Investigate the mismatch between headline revenue and regional/department revenue totals. Check relationships, duplicate rows, filter context, many-to-many joins and whether visuals use the same period and region selection.

3. Analyze the November revenue decline by product, customer, invoice date, department and region; identify whether it reflects seasonality, missing data or business performance.

4. Protect and grow the strongest revenue categories, especially Product Sales and Subscriptions, while monitoring gross margin and contribution rather than revenue alone.

5. Review Sales and Operations spending against their revenue and profit contribution; identify cost-saving opportunities without undermining service or growth.

6. Review Jeddah's expense share and the largest expense categories to identify controllable costs and local operational drivers.

7. Track rejected, approved and pending expenses by count, amount, department and aging; strengthen approval limits and follow-up controls.

8. Add clear metric definitions, currency, reporting dates, data-refresh timestamps and reconciliation checks to the published report.

Data Notes & Validation

All figures are transcribed from the supplied dashboard. The overview headline shows revenue 1.28M, while the revenue-by-region page displays 1.39M, 1.32M and 1.28M; the revenue-by-department visual also shows Sales at 1.41M. These chart values cannot be safely interpreted as additive components of the headline without further model context. Expense values on the expense page appear to reflect the selected Licensing category, so they should not be compared with all-category totals unless the slicer is reset. Confirm filters and measure definitions before relying on comparisons.
